Field audit on a staged ordinal (zebrafish GSE106474, 12 stages)

The full audit behind Figure 2, which draws the 9 measured rows only. Every score considered has a row: 9 measured, 2 blocked, 1 measured on another ordinal, 3 outside the audited class, 2 never measured.

	n	its own floor	clears it?
CytoTRACE v1 | gene count	39,505	+0.0247	yes
SCENT SR § | PCC(x, degree)	39,505	+0.0311	yes
ORIGINS § | PCC(x, degree)	39,505	+0.0247	yes
NCG | PCC(x, degree)	3,000 ‡	+0.0411	yes
dpath | Shannon H	3,000 ‡	+0.0411	yes
StemFinder | cell-cycle score	39,505	+0.0247	yes
SLICE | Shannon H	3,000 ‡	+0.0479	no, negative
CCAT § | PCC(x, degree)	39,505	+0.0115	no, negative
MCE § | PCC(x, degree)	39,505	+0.0325	no, negative
SPIDE | unresolved	—		*not measured*
scEnergy | no fixed primitive	—		*not measured*
StemSC | gene-pair order fraction	—		*measured elsewhere*
CytoTRACE 2 | supervised	—		*outside the class*
mRNAsi | trained	—		*outside the class*
FitDevo | trained	—		*outside the class*
StemID | Shannon H	—		*not a measurement*
cmEntropy | Shannon H, top 1,000 genes	—		*not a measurement*

‡ measured on the shared seed-42 3,000-cell subsample; a smaller n raises the floor, so these rows face 1.54 to 1.66 times the 39,505-cell floor at the same ρ. § orders the stages against its authors' polarity

clears its own null floor
blocked: no run artefact, reason on the row
does not clear its own null floor
measured, but on another ordinal
that row's floor: 97.5th pct of its own null, at its *n* and *ρ*
outside the unsupervised class audited here
95% bootstrap interval: sampling precision, not the verdict
by construction, never measured: no value
