

Field audit on a clean fine ordinal (zebrafish GSE106474, 12 stages)

The full audit behind Figure 2, which draws the 7 measured rows only. Every score considered has a row: 7 measured, 3 blocked, 1 measured on another ordinal, 1 outside the audited class, 2 never measured.

‡ measured on the shared seed-42 3,000-cell subsample; a smaller n raises the floor, so these rows face 1.54–1.66× the 39,505-cell floor at the same rho

clears its own null floor
blocked — no run artefact; reason on the row
does not clear its own null floor
measured, but on another ordinal
that row's floor: 97.5th pct of its own null, at its n and rho
outside the unsupervised class audited here
95% bootstrap interval — sampling precision, not the verdict
by construction, never measured — no value
