

Field audit on a clean fine ordinal (zebrafish GSE106474, 12 stages)

5 of 7 measured scores exceed their own measured null floor
every score considered has a row: 3 blocked, 1 measured on another ordinal, 1 outside the audited class, 2 never measured

‡ measured on the shared seed-42 3,000-cell subsample; a smaller n raises the floor, so these rows face 1.54–1.66× the 39,505-cell floor at the same rho

- clears its own null floor

that row's floor: 97.5th pct of this score's measured null, at its own n and rho

does not clear its own null floor

95% bootstrap interval — sampling precision, not the verdict
- blocked — no run artefact; reason on the row

measured, but on another ordinal — not comparable here

outside the unsupervised class this figure audits

by construction, never measured — no value
