Field audit on a clean fine ordinal (zebrafish GSE106474, 12 stages)

The full audit behind Figure 3, which draws the 9 measured rows only. Every score considered has a row: 9 measured, 2 blocked, 1 measured on another ordinal, 3 outside the audited class, 2 never measured.

‡ measured on the shared seed-42 3,000-cell subsample; a smaller n raises the floor, so these rows face 1.54 to 1.66 times the 39,505-cell floor at the same rho

clears its own null floor
blocked: no run artefact, reason on the row
does not clear its own null floor
measured, but on another ordinal
that row's floor: 97.5th pct of its own null, at its n and rho
outside the unsupervised class audited here
95% bootstrap interval: sampling precision, not the verdict
by construction, never measured: no value
